

Termite Problems? We have a solution!

At TermiGold we offer the homeowner or DIYer the opportunity to install a professional termite system around their home for a fraction of the cost.

We provide everything you need to get rid of termites, along with videos and tutorials to ensure you get professional results.

All TermiGold products are Australian made and owned. They are professional-grade and environmentally-friendly, so you can rest assured that your termite problem will be taken care of without causing damage to your home, your family or the natural environment.

Bait

- Australian owned and locally manufactured.
- APVMA registered
- Colony elimination guaranteed
- Most palatable on the market
- Independently tested and professionally used.

Baiting Stations

- Australian owned and locally manufactured
- Made from recycled engineer grade Nylon, 20 year UV rating.
- Most aesthetically pleasing
- Simple and efficient to install
- Custom designed from industry professionals.

TERMIGOLD 12 kit includes;

- 12 stations
- 12 lids
- 12 Cardboard (1 for each station)
- 48 timbers (4 for each station)
- 1kg Termigold Termite Bait
- 1 Measuring Jug
- Step by step guide for installation & baiting

\$ 449.00

TERMIGOLD 24 kit includes;

- 24 stations
- 24 lids
- 24 Cardboard (1 for each station)
- 96 timbers (4 for each station)
- 1kg Termigold Termite Bait
- 1 Measuring Jug
- Step by step guide for installation & baiting

\$ 699.00

TERMIGOLD 36 kit includes;

- 36 stations
- 36 lids
- 36 Cardboard (1 for each station)
- 144 timbers (4 for each station)
- 1kg Termigold Termite Bait
- 1 Measuring Jug
- Step by step guide for installation & baiting

\$ 899.00

TERMIGOLD 48 kit includes;

- 48 stations
- 48 lids
- 48 Cardboard (1 for each station)
- 192 timbers (4 for each station)
- 2kg Termigold Termite Bait
- 1 Measuring Jug
- Step by step guide for installation & baiting

\$ 1099.00

TERMIGOLD 60 kit includes;

- 60 stations
- 60 lids
- 60 Cardboard (1 for each station)
- 240 timbers (4 for each station)
- 2kg Termigold Termite Bait
- 1 Measuring Jug
- Step by step guide for installation & baiting

\$ 1299.00

How do the Stations Work?

So what we do with the stations is we place them at no more than three meter centres around your home creating a complete barrier, this is how we do it as professionals. The idea of the stations is, if termites are coming from an outside source, the colony is out here and we've got a barrier around your home, you're protected from trying to get access as they will v-line to the stations instead. The reason they go to the stations is the timber and the cardboard is giving off co2 in the soil which emulates a decaying log, so they're attracted to the co2 levels. Then when they get into the station, they feed on the timber, which is Tasmanian oak, one of their favourite food sources.

So that's how they get to the stations. The idea is to have a full system around your home, so it intercepts any foraging termites coming to your home. Once they're active in the station, you bait directly inside that hollow area and just keep baiting every three weeks, the termites will take the bait back to the colony and that's how we gain colony elimination from having the stations in the ground.

How Many Station Do I Need Around My Home?

If you measure the linear meters around your home where the stations are going to go – this might be around a patio, around a pool or just outside your footpaths. Once you have the whole distance, divide it by three, and that'll give you the amount of stations you need because we're running at three meter centres ie if you've got a 60 linear meter home (which is pretty common standard for a little three bedroom home) you'll need 20 stations. You can buy either a 12 pack, 24 pack, 30 pack, 48 pack or 60 pack, we also do custom packs.

How Does the Bait Work?

You bait directly on active termites and the termites take that back to the colony, which has got the queen in it. Our goal is to get rid of the queen, she's the barometer of the whole colony, so if you take out the queen the whole colony is gone within two weeks. The idea of the bait is the workers feed on the bait, so you put it on active termites, whether it's in your house, in your sleepers, in a tree, anywhere you find active. They're taking that bait back to the colony, they're a social animal, they're passing it to each other, the workers are feeding the soldiers and the queen. So it doesn't matter how far the queen is away from the source, they're taking the bait back to that point.

Termites molt several times a year, when they eat large amounts of the bait it stops their molting process and that kills off the workers who feed the soldiers and the queen, so the queen and the soldiers die of starvation. Also, when the workers die in the molting process, they give off ammonia, which is like a gas that also kills the queen. So that's how you get colony elimination, once the queen's gone, the colony's gone within two weeks. It's not a super quick process, it depends on what sort of species it is, but once they start feeding on the bait, you're guaranteed, you'll get full colony elimination in time.
